

Get Outside to Beat Winter Blues

Shorter days, colder weather, and increased time spent indoors in the winter can lead to feelings of moodiness and depression. Even if you live in a warmer climate, you may still feel the effects of some sadness in the winter, especially after the holidays pass. Getting outdoors can improve your mood in these ways:

- Exposure to sunlight increases levels of serotonin, a mood booster
- Awakens the senses to help you feel more alert
- Fresh air can be rejuvenating and help clear away the cobwebs that are often experienced with “cabin fever”
- When combined with exercise, the endorphins produced can help improve mood

If you are noticing a pattern of feeling down every winter and it is impacting your daily functioning over a significant period of time, you might be experiencing Seasonal Affective Disorder (SAD). There are many effective treatment options. Contact your health care provider or arrange to meet with a counselor free of charge through your Employee Assistance Program. Contact Kepro at the number below to get started.
